NAME

CUTEST_cish_threaded − CUTEst tool to evaluate the Hessian of an individual problem function, in sparse format.

SYNOPSIS

CALL CUTEST_cish_threaded(status, n, X, iprob, nnzh, lh, H_val, H_row, H_col, thread)

DESCRIPTION

The CUTEST_cish_threaded subroutine evaluates the Hessian of a particular constraint function or the objective function for the problem decoded from a SIF file by the script *sifdecode* at the point X, and possibly its gradient. The matrix is stored in sparse format.

The problem under consideration is to minimize or maximize an objective function $f(x)$ over all $x \in R^n$ subject to general equations $c_i(x) = 0$, $(i \in 1, \ldots, m_E)$, general inequalities $c_i^l(x) \leq c_i(x) \leq c_i^u(x)$, $(i \in m_E + 1, \ldots, m)$, and simple bounds $x^l \leq x \leq x^{u.}$ The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_cish_threaded are as follows

status [out] - integer
the outputr status: 0 for a succesful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

n [in] - integer
the number of variables for the problem,

X [in] - real/double precision
an array which gives the current estimate of the solution of the problem,

iprob [in] - integer
the number of the problem function to be considered. If iprob = 0, the Hessian of the objective function will be evaluated, while if iprob = i > 0, that of the i-th constraint will be evaluated.

nnzh [out] - integer
the number of nonzeros in H_val,

lh [in] - integer
the actual declared dimensions of H_val, H_row and H_col,

H_val [out] - real/double precision
an array which gives the values of the Hessian matrix of the Lagrangian function evaluated at X and Y. The i-th entry of H_val gives the value of the nonzero in row H_row(i) and column H_col(i). Only the upper triangular part of the Hessian is stored,

H_row [out] - integer
an array which gives the row indices of the nonzeros of the Hessian matrix of the objective function evaluated at X and Y, and

H_col [out] - integer
an array which gives the column indices of the nonzeros of the Hessian matrix of the objective function evaluated at X and Y,

thread [in] - integer
thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEST_csetup_threaded.
