

**NAME**

CUTEST\_cofg\_threaded – CUTEst tool to evaluate function value and possibly gradient.

**SYNOPSIS**

CALL CUTEST\_cofg\_threaded( status, n, X, f, G, grad, thread )

**DESCRIPTION**

The CUTEST\_cofg\_threaded subroutine evaluates the value of the objective function of the problem decoded from a SIF file by the script *sifdecode* at the point X, and possibly its gradient.

The problem under consideration is to minimize or maximize an objective function  $f(x)$  over all  $x \in R^n$  subject to general equations  $c_i(x) = 0$ , ( $i \in 1, \dots, m_E$ ), general inequalities  $c_i^l(x) \leq c_i(x) \leq c_i^u(x)$ , ( $i \in m_E + 1, \dots, m$ ), and simple bounds  $x^l \leq x \leq x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

**ARGUMENTS**

The arguments of CUTEST\_cofg\_threaded are as follows

**status** [out] - integer

the output status: 0 for a succesful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

**n** [in] - integer

the number of variables for the problem,

**X** [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

**f** [out] - real/double precision

the value of the objective function evaluated at X,

**G** [out] - real/double precision

an array which gives the value of the gradient of the objective function evaluated at X,

**grad** [in] - logical

a logical variable which should be set to .TRUE. if the gradient of the objective function is required and .FALSE. otherwise,

**thread** [in] - integer

thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEST\_csetup\_threaded.

**NOTE**

A call to CUTEST\_cofg\_threaded is more efficient than two separate calls to CUTEST\_cfn\_threaded and CUTEST\_cgr\_threaded.
