

**NAME**

CUTEST\_cdimsj – CUTEst tool to determine number of nonzeros to store the matrix of gradients of the objective function and constraints, in sparse format.

**SYNOPSIS**

CALL CUTEST\_cdimsj( data, status, nnzj )

**DESCRIPTION**

The CUTEST\_cdimsj subroutine determines the number of nonzero elements required to store the matrix of gradients of the objective function and constraint functions for the problem decoded into OUTSDIF.d in the constrained minimization case. The matrix is stored in sparse format.

The problem under consideration is to minimize or maximize an objective function  $f(x)$  over all  $x \in R^n$  subject to general equations  $c_i(x) = 0$ , ( $i \in 1, \dots, m_E$ ), general inequalities  $c_i^l(x) \leq c_i(x) \leq c_i^u(x)$ , ( $i \in m_E + 1, \dots, m$ ), and simple bounds  $x^l \leq x \leq x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

**ARGUMENTS**

The arguments of CUTEST\_cdimsj are as follows

**data** [inout] - CUTEST\_data\_type derived type  
problem-specific private data,

**status** [out] - integer  
the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

**nnzj** [out] - integer  
the number of nonzero elements in the Jacobian matrix.
