

**NAME**

CUTEST\_cdimen – CUTEst tool to get the number of variables and constraints involved.

**SYNOPSIS**

CALL CUTEST\_cdimen( input, status, n, m )

**DESCRIPTION**

The CUTEST\_cdimen subroutine discovers how many variables and constraints are involved in the problem decoded from a SIF file by the script *sifdecode*.

The problem under consideration is to minimize or maximize an objective function  $f(x)$  over all  $x \in R^n$  subject to general equations  $c_i(x) = 0$ , ( $i \in 1, \dots, m_E$ ), general inequalities  $c_i^l(x) \leq c_i(x) \leq c_i^u(x)$ , ( $i \in m_E + 1, \dots, m$ ), and simple bounds  $x^l \leq x \leq x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

**ARGUMENTS**

The arguments of CUTEST\_cdimen are as follows

**input** [in] - integer

the unit number for the decoded data; the unit from which OUTSDIF.d is read,

**status** [out] - integer

the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

**n** [out] - integer

the number of variables for the problem,

**m** [out] - integer

the total number of general constraints.

**AUTHORS**

I. Bongartz, A.R. Conn, N.I.M. Gould, D. Orban and Ph.L. Toint
